A faster way to reach 911 that creates a unique partnership between the private and public sectors

Also available for computers

IRVINE, CA—In the aftermath of recent active-shooter and other workplace-violence incidents that have occurred, some organizations impacted by these events reported having difficulty reaching 911. Some couldn't get through while others reported being placed on hold. In today's threatening security environment, when someone is critically injured, the inability to reach 911 could prove costly not just from the potential loss of life but also because of the impact on an organization's bottom line and reputation.

With StreamQuik's QuikHelp™ system, business enterprise customers such as schools, hospitals and others can use their smartphones, tablets and computer/laptop browsers to send an alert for help by simply tapping/click-

ing a button without needing any special apps, hardware or software. What makes QuikHelp unique is when these alerts are sent, they include critical location information that tells responders where help is needed even from within a building where GPS doesn't work. This information makes locating those in need of help faster and easier so that no time is wasted searching when every second counts.

Once these alerts are received by in-house security personnel and/or management via the QuikHelp browser-based monitor, they can be quickly vetted and forwarded to police/fire/911 agencies as special text-to-911 messages that bypass the cellular carriers for greater speed and reliability. When each alert is received by dispatchers, it pops up automatically in a standard web browser that dispatchers have now without tying up incoming phone lines at 911 agencies. Since the alerts are pre-vetted, 911

agencies can respond with the confidence of knowing that each alert for help is legitimate. The result: Critical incident information can be made available to police/fire/911 dispatchers faster without wasting resources resulting in quicker response times. Alerts can also be delivered to responder vehicles and to their smartphones at the same time to help speed response even more. Other QuikHelp system features include one-to-many text-messaging and the optional sharing of live incident security-camera video, recorded video and photos with responders from just about any existing security camera system.

Unlike other solutions that require the installation, maintenance and support of special apps, hardware and software, QuikHelp eliminates these burdens using a simple internet browser on both the send and receive side of the emergency-notification process. The system's simple architecture makes deployment easy in less than 3 minutes without having to retrofit or install anything—training takes about the same amount of time. QuikHelp can also be deployed on private networks such as Mesh and others.

Access to the QuikHelp system is available at no cost to police/fire/911 agencies for basic access when their local business enterprises deploy the system and grant these agencies access.

To schedule a live demo in person or over the phone, call StreamQuik @ 949.502.6741. An internet browser with unfettered outside internet access is all that's needed to view the demo.
